.

Balanced Array

Given an array of numbers, find the index of the smallest array element (the pivot), for which the sums of all elements to the left and to the right are equal. The array may not be reordered.

Example
arr=[1,2,3,4,6]
·   the sum of the first three elements, 1+2+3=6. The value of the last element is 6.
·   Using zero based indexing, arr[3]=4 is the pivot between the two subarrays.
·   The index of the pivot is 3.

Constraints
· $3 \leq n \leq 10^5$
· $1 \leq arr[i] \leq 2 \times 10^4$, where $0 \leq i < n$
·   It is guaranteed that a solution always exists.

The first line contains an integer n, the size of the array arr.

Each of the next n lines contains an integer, arr[i], where $0 \leq i < n$.

Sample Case 0

Sample Input 0

4
1   2
3
3

Sample Output 0

2

Explanation 0

The sum of the first two elements, 1+2=3. The value of the last element is 3
Using zero based indexing, arr[2]=3 is the pivot between the two subarrays
The index of the pivot is 2

Sample Case   1
Sample Input   1
1 2 1   1
Sample Output   1
Explanation   1
The first and last elements are equal toUsing zero based indexing, arr[1]=2 is the pivot
between the two subarrays The index of the pivot is 1.   **Error! Bookmark not defined.**

3
1

For example:

Input	Result
4 1 2 3 3	2
3 1 2 1	1

Program:

a=int(input())

l=[] for i in

range(a):

c=int(input())

   l.append(c) for i

in range(1,a):

d=sum(l[0:i])

r=sum(l[i+1:])

if(d==r):

print(i)

Output:

	Input	Expected	Got	
✔	4 1 2 3 3	2	2	✔
✔	3 1 2 1	1	1	✔

Passed all tests! ✔

'

Check pair with difference k

Given an array A of sorted integers and another non negative integer k, find if there exists 2 indices i and j such that A[i] - A[j] = k, i != j.

Input Format
1.   First line is number of test cases T. Following T lines contain:
2.   N, followed by N integers of the array
3.   The non-negative integer k

Output format

Print 1 if such a pair exists and 0 if it doesn't

    Input
    1
    3
    1
    3
    5
    4
    Output:
    1
    Input
    1
    3
    1
    3
    5
    99
    Output
    0

    For example:

Input	Result

1 3 1 3 5 4	1

Input	Result
1 3 1 3 5 99	0

Program:

a=int(input()) while(a!=0):
b=int(input())   l=[]   f=0
for i in range(b):
c=int(input())
l.append(c)   k=int(input())
a-=1   for i in range(b):
for j in range(b):
if(l[i]-l[j]==k and i!=j):
        f=1
break
if(f==1):
print(1)   else:
print(0)

Output:

	Input	Expected	Got	
✔	1 3 1 3 5 4	1	1	✔
✔	1 3 1 3 5 99	0	0	✔

Passed all tests! ✔

Count Elements

Complete the program to count frequency of each element of an array. Frequency of a particular element will be printed once.

Sample Test Cases

Test Case 1

Input

7

23

45

23

56

45

23

40

Output

23 occurs 3 times
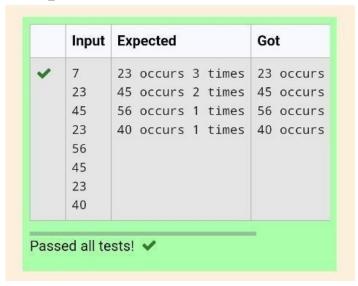

45 occurs 2 times

56 occurs 1 times

40 occurs 1 times

Program:

import collections def

CountFrequency(arr):

return collections.Counter(arr)

```python
if __name__ == "__main__":

    # Input size of array

    n = int(input())

    # Input elements in array

    arr = []        for _ in

range(n):

    ele = int(input())

    arr.append(ele)

    # Calculate frequency of each element

    freq = CountFrequency(arr)

    for key, value in freq.items():

    print(f"{key} occurs {value} times")
```

Output:

	Input	Expected	Got
✔	7 23 45 23 56 45 23 40	23 occurs 3 times 45 occurs 2 times 56 occurs 1 times 40 occurs 1 times	23 occurs 45 occurs 56 occurs 40 occurs

Distinct Elements in an Array

Program to print all the distinct elements in an array. Distinct elements are nothing but the unique (non-duplicate) elements present in the given array.

Input Format:

First line take an Integer input from stdin which is array length n.

Second line take n Integers which is inputs of array.

Output Format:

Print the Distinct Elements in Array in single line which is space Separated

Example Input:

5

1

2

2

3
4
Output:
1 2 3 4
Example Input:

.

Find the Factor

Determine the factors of a number (i.e., all positive integer values that evenly divide into a number) and then return the pth element of the list, sorted ascending. If there is no p^{th} element, return 0.

Constraints

$1 \le n \le 10^{15}$

$1 \le p \le 10^9$

The first line contains an integer n, the number to factor.

The second line contains an integer p, the 1-based index of the factor to return.

Sample Case 0
Sample Input 0
10
3
Sample Output 0
5
Explanation 0
Factoring n = 10 results in {1, 2, 5, 10}. Return the p = 3rd factor, 5, as the answer.
Sample Case 1
Sample Input 1
10
5
Sample Output 1
0
Explanation 1
Factoring n = 10 results in {1, 2, 5, 10}. There are only 4 factors and p = 5, therefore 0 is returned as the answer.
Sample Case 2
Sample Input 2
1
1
Sample Output 2
1
Explanation 2
Factoring n = 1 results in {1}. The p = 1st factor of 1 is returned as the answer.

For example:

Input	Result
10 3	5
10 5	0
1 1	1

Program:

import sys import

math

def find_factors(n):

    factors = []

    for i in range(1, int(math.sqrt(n)) +

1):   if n % i == 0:   factors.append(i)

    if i != n // i:

        factors.append(n // i)

return sorted(factors)

def get_pth_factor(n, p):

factors = find_factors(n)   if p

<= len(factors):   return

factors[p - 1]

else:

        return 0

Reading input directly from the standard input (typically for competitive

programming) input = sys.stdin.read data = input().split() n = int(data[0])

p = int(data[1])

Calculate and print the p-th factor print(get_pth_factor(n,

p))

Output:

	Input	Expected	Got	
✔	10 3	5	5	✔
✔	10 5	0	0	✔
✔	1 1	1	1	✔

Passed all tests! ✔

Print Element Location

Write a program to print all the locations at which a particular element (taken as input) is found in a list and also print the total number of times it occurs in the list. The location starts from 1.

For example, if there are 4 elements in the array:
5
6
5
7

If the element to search is 5 then the output will be:
5 is present at location 1
5 is present at location 3
5 is present 2 times in the array.
Sample Test Cases

Test Case 1
Input

4
5
6
5
7
5

Output

5 is present at location 1.
5 is present at location 3.
5 is present 2 times in the array.

Test Case 2
 Input
5
67
80
45
97
100
50

Output
50 is not present in the array.

Program:

```python
def find_element_locations(lst, target):
    locations = []    count
= 0    for i in
range(len(lst)):        if
lst[i] == target:
        locations.append(i + 1)
count += 1

    return locations, count

def main():
    n = int(input())    lst =
[int(input()) for _ in range(n)]
target = int(input())

    locations, count = find_element_locations(lst, target)

    if count == 0:
        print(f"{target} is not present in the array.")
else:        for loc in locations:
        print(f"{target} is present at location {loc}.")
print(f"{target} is present {count} times in the array.")

if__name__== "_main_":
    main()
```

Output:

	Input	Expected
✔	4 5 6 5 7 5	5 is present at location 1. 5 is present at location 3. 5 is present 2 times in the ⦂
✔	5 67 80 45 97 100 50	50 is not present in the arr⦂
